SOURCE & DATA VERIFICATION WORK SAMPLE

Mooyeon LEE | Selected verification workflow and audit-trail examples

Basis. This page is reconstructed from actual working verification logs used while preparing public SSRN/OSF research drafts. It shows how I tracked source status, separated AI-assisted discovery from my own verification, and corrected claims when deeper source review changed the evidence. Items that were not fully checked remained explicitly unresolved.

1. Verification-state workflow used in the DLCA project

Working pattern: search / source retrieval → cross-check → explicit status → correction → auditable note.

Actual log excerpt (translated and condensed). The original working table separately tracked AI-assisted review and my own verification.

AI-assisted review states: Confirmed · Checked · Partially checked · Suggested · Unsearched. Suggested meant an AI-proposed source or URL to investigate; it was not treated as opened or verified. Author verification was tracked separately as Not started / Partial / Verified / Error found.

Source / claim	AI-assisted review	My review	Actual verification note
Jefferson → Madison (1789)	Checked	Verified	Retrieved the Founders Online bibliographic record directly.
Ackerman, We the People	Checked	Verified	Searched the source text directly; the concept was distributed across passages, so I kept a whole-book citation rather than inventing a pinpoint page.
UK recognition memorandum (1950)	Confirmed	Verified	Reviewed an archival scan through a paid academic database; recorded the underlying UK National Archives (Kew) references: FC 1022/78A and FO 371/83281.
Kesavananda Bharati (1973)	Unsearched	Not started	AI suggested India Kanoon as a possible starting URL. Because it had not been opened or checked, it remained unverified.
Hungary 2010 election result	Unsearched	Not started	An approximate vote figure existed in notes, but the official result had not been checked, so the item remained open.

2. Correction example: deeper verification changed the claim

• **Initial draft:** a repeated secondary-source formulation said the Weimar Constitution was never formally repealed and remained legally effective through the Allied occupation until 1949.

• **Primary-source check:** I reviewed the 5 June 1945 Berlin Declaration and U.S. FRUS material on the postwar constitutional process. Those sources exposed a major discontinuity that the simplified formulation had hidden.

• **Correction:** I revised the claim and separately traced how Article 140 of the German Basic Law selectively incorporated specific Weimar provisions. The log recorded both the correction and why the previous “Checked” state had not been sufficient.

Additional quantitative verification (URI): when a published paper did not make the exact count easy to recover, I checked the authors’ public Jupyter notebook and recorded the underlying figures: 75,099 papers in the sample, 76 explicit AI-use disclosures, or 0.1012%.

Traceability	Status discipline	Discrepancy handling	Audit trail
claim → source	verified ≠ suggested	revise when evidence changes	record what remains open

3. Public outputs corresponding to these logs

DLCA — main verification case: https://doi.org/10.17605/OSF.IO/H28WG

Unconditional Research Income — quantitative/source checks: https://dx.doi.org/10.2139/ssrn.7330918

Universal Participation Floor — separate AI/author verification workflow: https://doi.org/10.17605/OSF.IO/QM9EP

Scope note. These examples are drawn from independent research and are included to demonstrate transferable verification behavior: source tracing, accuracy/completeness checks, explicit status control, discrepancy resolution, and an auditable record of what was and was not verified.
